

Unified PAM: MSP Edition

One PAM Platform for Every Customer Environment.

Secure and manage privileged access for all your customers from a single multi-tenant deployment. Segregate each customer's data, apply customer-specific controls, and deliver PAM as a fully managed or co-managed service.

Multi-Tenant PAM Management

Onboard and manage customer organizations from one platform, with a separate administrative boundary for each.

Customer Data Segregation

Keep each customer's privileged access data isolated from other managed organizations.

Fully Managed or Co-Managed

Fully manage PAM for your customers or share administration with customer IT teams based on their requirements.

Built for the Way Managed Services Providers (MSP) Operate

Client-Specific Administration & Controls

Set administrators, roles, policies, approval workflows, MFA, and enabled features independently for each customer.

Secure Client Connectivity

Deploy lightweight, outbound-only Remote Connectors within client networks to establish privileged sessions with the MSP-hosted PAM server.

Controlled Technician Access

Secure technician access to managed endpoints, with control over which applications they can elevate during support sessions.

Simple Per-User Licensing

Pay per user, not per client. Manage unlimited client organizations within your purchased license count.

Truly Unified Privileged Access Security

Enterprise Password Management

Vault, share, and rotate privileged passwords, shared accounts, service account credentials, and SSH keys.

Privileged Account & Session Mgmt

Discover privileged accounts and launch RDP, SSH, and SQL sessions without exposing credentials. Monitor, record, and audit privileged sessions.

DevOps Secrets Management

Protect API keys, tokens, application credentials, and CI/CD secrets used by DevOps tools and pipelines.

Self-Service Password Reset

Enable users to reset passwords and unlock accounts across Active Directory and Microsoft Entra ID environments.

Endpoint Privilege Management

Remove local admin rights, control which applications can run or elevate, and grant temporary elevation on demand across MSP and customer endpoints.

Just-in-Time Privileged Access

Grant time-bound access to passwords and remote connections through approval workflows, then revoke it automatically when the approved period expires.

Centralized Audit Visibility

Review privileged activity and MSP administrator actions across all customer environments from one place, with customer-level segregation maintained.
