Certificate Lifecycle Management

Manage certificate issuance, deployment,and renewal from one place, and know what is expiring before it disrupts a service.

- Inventory
- Requests and templates
- Issuance
- Deployment
- Renewal
- Audit and reporting

Keep certificates under control, from issuance to renewal

SSL/TLS certificates arespread acrossservers, applications, and environments, often issued by different teams and certificate authorities. When certificate records and renewal dates are scattered, even one overlooked expiry can disrupt a critical service.

Securden Certificate Lifecycle Management brings certificate inventory, issuance, deployment, and renewal into one place. Teams manage certificate requests, track expirations, and maintain a record of certificate activity without working across multiple systems.

Certificate inventory

Know which certificates you have

Bring certificates issued through Securden, imported from connected sources, and added manually into a single inventory.

See what each certificate holds

Each entry carries its common name, issuer, organization and location details, key algorithm, key size, and validity dates.

For IT operations, security engineering, and platform teams.

Securden

Certificate Lifecycle Management

Certificate issuance

Createrequests from reusable templates

Raise certificate signing requests using templates that hold your organization details, so each request needs only the fields specific to it.

Issuefrom private and public authorities

Create and manage a private root certificate authority for internal systems, or connect public certificate authorities and ACME providers.

Deployment & renewal

Deploy from the same interface

Deploy issued certificates to Windows systems and the Microsoft Certificate Store, without a separate tool for issuance and deployment.

Stay ahead of expirations

See which certificates have already expired and which are due to expire within the next seven days, ordered by remaining validity, and renew from the inventory.

Audit & reporting

Keep an audit trail

Securden captures the user, source IP address, timestamp, and reason for each action performed on a certificate or signing request.

Report on what needs attention

Prebuilt reports cover certificates expiring within a period you choose, certificates that have already expired, and self-signed certificates. Export in PDF, CSV, or XLSX.

Part of the Securden Unified PAM platform

Certificate Lifecycle Management is available as a separately licensed capability within Securden Unified PAM. It can be used independently of Securden's NHI Security Platform, or alongside it to extend visibility across non-human identities, secrets, and certificates.

Renew every certificate before it expires.
